

Session-Based Execution & Capital Plan

Objective

Deploy the harmonic-square-confluence trading system with **maximum structural edge, minimal noise,** and **strict capital discipline**, starting **February 1**. The system will only execute **non-null signals** and will remain inactive otherwise.

This document defines: - When the server should be ON / OFF - Which sessions provide the highest-quality signals - Capital deployment assumptions - Position limits and consistency rules

Core Philosophy

We trade anticipation, not recognition.

The system performs best when: - Liquidity is present but not chaotic - Volatility is emerging, not extreme - Institutions are positioning, not distributing

Therefore, session selection is critical.

Session Selection (MOST IMPORTANT)

1. Primary Execution Window (HIGH PRIORITY)

London Session (08:00–11:00 UTC)

This is the *core execution window*.

Why: - Institutional positioning begins - Metals and FX respect structure - Volatility transitions from compression → expansion - Harmonics and Square-of-Nine align cleanly

Server State: -  ON - Full signal evaluation - All symbols enabled

2. Secondary Execution Window (CONDITIONAL)

London–New York Overlap (12:00–15:00 UTC)

Used primarily for: - Campaign continuation - Confirmation of earlier signals - Management of open positions

Why: - Peak liquidity - Strong continuation moves - Risk transfer often occurs here

Rules: - New positions ONLY if: - Signal is non-null - Not EXTREME volatility OR is early EXTREME with clear asymmetry

Server State: -  ON - Slightly stricter filters

3. New York Late Session (LOW PRIORITY)

15:00-17:00 UTC

Purpose: - Monitoring only - No new trades unless exceptional

Why: - Late participation - Increased chance of distribution - Reduced structural clarity

Server State: -  ON (monitoring mode) -  No new entries by default

4. Asian Session (OFF)

00:00-06:00 UTC

Why OFF: - Thin liquidity for metals - Crypto noise dominates - Harmonic distortions common - Poor risk asymmetry

Server State: -  OFF

Symbol-Specific Session Bias

Symbol Group	Preferred Session
XAUUSD / XAGUSD	London → Early NY
FX Majors	London
Crypto (ETH/BTC)	London overlap only
Crosses	London only

Capital & Position Framework (BASELINE)

Assumptions

- Average: **6 positions per month**
- All positions sized to **0.01 XAUUSD-equivalent risk**
- No compounding
- No pyramiding

Exposure Rules

- Max positions per symbol: **2**
- Max total open positions: **4**
- No correlated stacking (e.g., Gold + Silver + BTC all at once)

Position Sizing

- Reference unit: **0.01 lot XAUUSD**
- Less volatile symbols are sized UP to match gold volatility
- More volatile symbols (crypto) are sized DOWN accordingly

Sizing is always:

Risk-based, stop-defined, structure-invalidated

If broker minimum lot > required lot → **trade is skipped**.

Monthly Expectation (Conservative)

- Avg trades: 6
- Avg return per trade: \$300–400

Expected monthly range: - \$1,800 – \$2,400

Annual (Feb–Dec): - \$20,000 – \$30,000 (no scaling)

Consistency Rules (MANDATORY)

1. Null signal = No trade (no exceptions)
2. Only trade during defined sessions
3. One signal = one decision (no re-interpretation)
4. No size increase mid-year

5. No emotional overrides after wins
 6. First loss changes nothing
-

What This Plan Protects

- Structural edge
 - Psychological stability
 - Capital survival
 - Scalability potential
-

Review Cadence

- Weekly: behavioral review (not PnL)
- Monthly: signal quality review
- Quarterly: drawdown & expectancy check

No parameter changes during the year.

Final Statement

Silence is a position.

The system is allowed to do nothing most days. That inactivity is what funds the rare moments of precision.

Start Date: February 1 **Duration:** 12 months **Rule:** Execute exactly as written
